PROJECT REPORT

TITLE : HANGMAN GAME

Submitted by : P. Rajasree
Submitted to : Global Quest Technologies
Date : 13 June 2026

ABSTRACT

The **Hangman Game** is a Python-based application designed to provide an interactive and engaging word-guessing experience for users. The game randomly selects a word from a predefined list, and the player attempts to guess the word by suggesting one letter at a time within a limited number of attempts. For each incorrect guess, a part of the hangman figure is drawn, increasing the challenge and excitement of the game.

This project is developed using core Python concepts such as loops, conditional statements, strings, and lists. It demonstrates how user input can be processed and validated while maintaining game logic and flow. The program continuously updates the display to show correctly guessed letters and remaining attempts, providing real-time feedback to the player.

The Hangman Game highlights the practical application of Python in developing simple yet interactive games. It can be further enhanced by adding features such as difficulty levels, graphical user interface, score tracking, and word categories, making it more dynamic and user-friendly.
