PROJECT REPORT

TITLE : STUDY PLANNER

Submitted by : P. Rajasree

Submitted to : Global Quest Technologies

Date : 13 June 2026

ABSTRACT

The **Study Planner** is a Python-based application designed to help students organize and manage their study schedules effectively. The system allows users to create, view, and update daily or weekly study plans by allocating time for different subjects or tasks. It aims to improve productivity by promoting structured learning and better time management.

The application is developed using core Python concepts such as lists, dictionaries, file handling, and conditional logic. Users can input subjects, set priorities, and assign specific time slots, while the program stores and retrieves this data for future use. The planner can also provide reminders or alerts for scheduled tasks, ensuring that users stay on track with their study goals.

This project demonstrates the practical application of Python in solving real-life problems related to time management and productivity. It can be further enhanced by adding features such as graphical user interface, progress tracking, and intelligent scheduling, making it a useful tool for students to plan their academic activities efficiently.
